

Post-operative Instructions

Yag Laser Vitreolysis

- Continue to use any previously prescribed eye drops as directed.
- Use Lotemax or Flarex, one drop to the operative eye 4 times per day for 4 days.
- It is quite common to experience a sensation of something in the eye with tearing and a slight runny nose on the side of the eye that had surgery. This comes from minor corneal irritation from the contact lens used during surgery. This is almost always better the morning following surgery.
- If you have increasing pain or redness of the eye after the laser, please notify the office.
- Please be sure to keep your scheduled post-operative appointment.
